

Exercício FLT – Flambagem Lateral com Torção

Uma viga de piso biapoiada de perfil laminado I: W 360 x 39,0kg/m foi submetida a um carregamento linear de $q=0,32$ kN/cm (já majorado) sem contenção lateral no vão central (vão $L=342$ cm). Verificar se o perfil atende aos esforços de flexão (somente FLT). Adote Aço $f_y=34,5$ kN/cm². $E=200$ GPa. $\sigma_r=0,3 f_y$.

$$\begin{aligned} C_w &= 109551,00 \text{ cm}^6 \\ I_x &= 10331,00 \text{ cm}^4 \\ I_y &= 375,00 \text{ cm}^4 \\ W_x &= 585,30 \text{ cm}^3 \\ Z_x &= 667,70 \text{ cm}^3 \\ r_y &= 2,73 \text{ cm} \\ J &= 15,83 \text{ cm}^4 \end{aligned}$$

$$\begin{aligned} M_A &= 3508,92 \text{ kN.cm} \\ M_B &= 4678,56 \text{ kN.cm} \\ M_C &= 3508,92 \text{ kN.cm} \\ M_{\max} &= 4678,56 \text{ kN.cm} \end{aligned}$$

$$\lambda_{flt} = \frac{L_b}{r_y} = 125,27$$

$$\lambda_p = 1,76 \sqrt{\frac{E}{f_y}} = 42,38$$

$$\beta_1 = \frac{W_x(f_y - \sigma_r)}{E J} = 0,04465$$

$$\lambda_r = \frac{1,38 \sqrt{I_y J}}{r_y J \beta_1} \sqrt{1 + \sqrt{1 + \frac{27 C_w \beta_1^2}{I_y}}} = 124,32$$

$$C_b = \frac{12,5 M_{\max}}{2,5 M_{\max} + 3 M_A + 4 M_B + 3 M_C} = 1,136$$

$$\rightarrow \text{Se } \lambda_{flt} \leq \lambda_p \text{ então } M_{Rd} = \frac{M_{pl}}{\gamma_{a1}}$$

$$M_{pl} = Z_x f_y = 23035,65$$

$$\rightarrow \text{Se } \lambda_p < \lambda_{flt} \leq \lambda_r \text{ então } M_{Rd} = \frac{M_s}{\gamma_{a1}}$$

$$M_r = W_x(f_y - \sigma_r) = 14134,99$$

$$M_s = C_b \left[M_{pl} - (M_{pl} - M_r) \frac{\lambda_{flt} - \lambda_p}{\lambda_r - \lambda_p} \right] = 15944,47$$

$$\rightarrow \text{Se } \lambda_{flt} > \lambda_r \text{ então } M_{Rd} = \frac{M_{cr}}{\gamma_{a1}}$$

$$M_{cr} = \frac{C_b \pi^2 E I_y}{L_b^2} \sqrt{\frac{C_w}{I_y} \left(1 + 0,039 \frac{J L_b^2}{C_w} \right)} = 15832,92$$

Portanto, Viga Longa

$$M_{Rd} = 14393,6 \text{ kN.cm} > M_{Sd} = 4678,6 \text{ kN.cm}$$
